- Supports multiple controllers.
- Read C-Bus group names from Toolkit.
- Firmware can be Upgraded in the field.
- Configuration utility included.
- Configuration lock.
- DIN rail mounting.

The Translink group of products provide a gateway into a Clipsal C-Bus network, and present the user with an easy to use interface with real time viewing and control of their network.

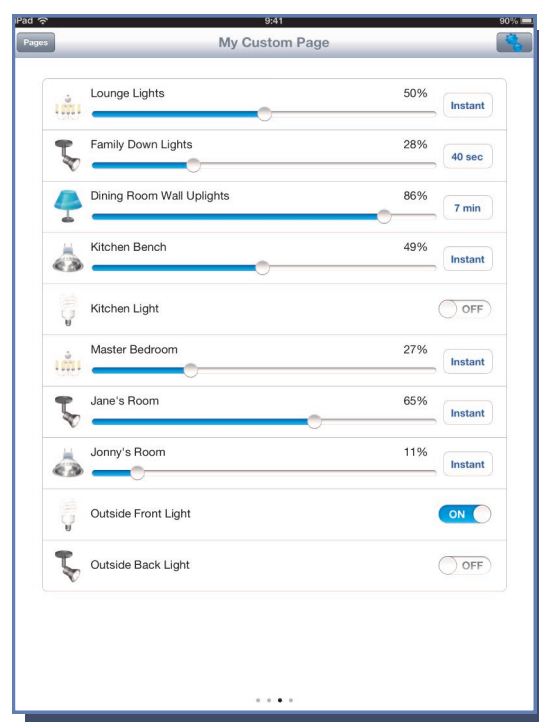

Designed for home and commercial use, the Translink can be used where ever wireless control is needed.

The Translink App is a native Apple iOS application which runs on both the iPad and iPhone as well as the iPod Touch (which is particularly useful when used as a low cost remote control for conference rooms or presentation areas).

In Addition the iOS app allows for user customisation of pages, enabling the end user to setup or change the pages as they like without the need for a service call by the installer.

Multiple Translink Controllers can be accessed from a single iOS device by simply selecting from a menu. Each Translink controller has its own set of configuration pages.

- The Translink C-Bus gateway provides wireless 2 way communication and control of Clipsal C-Bus lighting systems using Apple's iPhone, iPad or iPod Touch.
- Consisting of a combination of hardware controller and software app, the Translink allows users the freedom of monitoring and control from anywhere inside their wireless network, or anywhere in the world via the internet.
- Easy to install and easy to configure, with the ability for end users to setup and change pages however and whenever they like.
- Available in several tiers and price points to suit the smallest or largest installation
